## POWER

## PROGRAMMING

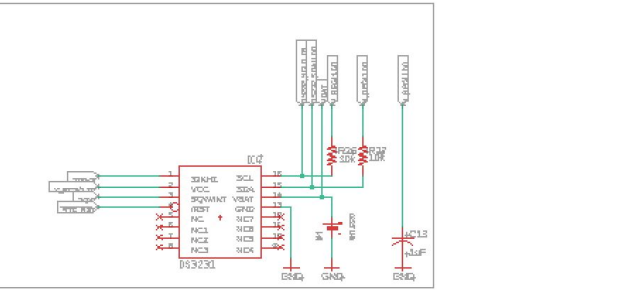

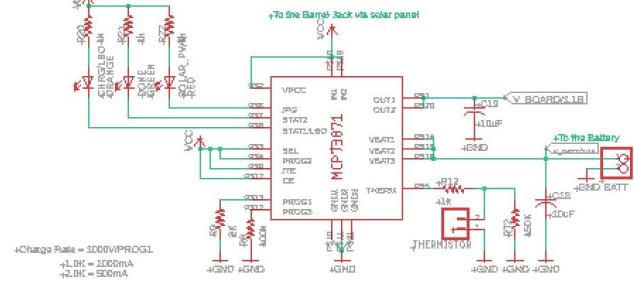

## MICROCONTROLLER

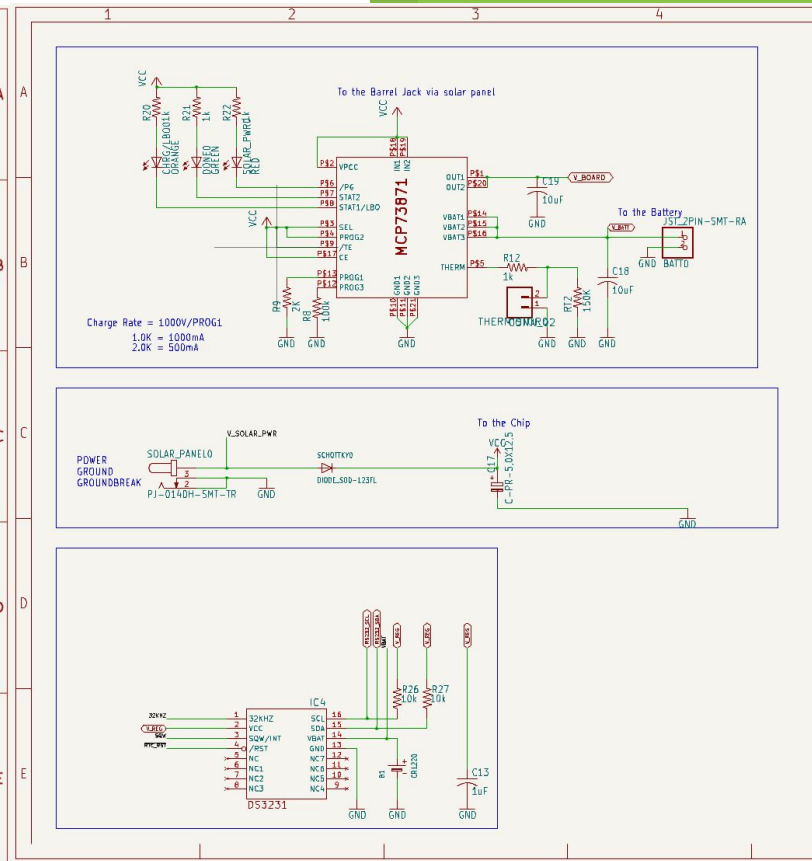

## SENSORS

## XBEE COMMUNICATION

# REV E1

## Project **Goals**

Design & fabricate a self-sustaining environmental sensor module that will collect meteorological data

- On-board Andy & Korie
- Verify all operations of the board
- Create a Guava Network
- Research & Develop potential wind sensor

# Progress **Fall 2024**

- Ordered new PCBs and other parts
- Troubleshoot last semester's boards
- Reconstructed Bare Guava
- Bootloaded Bare Guava
- Watched KiCad tutorials
- Converted old EAGLE schematic to KiCad
- Started the process of designing a new board
- Ready to deploy TWO weatherboxes

# Bare Guava

- Reconstructed Bare Guava
- Attempted to bootload
- Failed bootloading
  - Trouble with wiring
  - Couldn't understand schematic

# Integrating Wind **Sensor**

- Cup Anemometer
  - Input Voltage Requirement: 7-24V
    - Additional battery pack or Voltage Boost Converter
  - ADC (Analog to digital converter) on ATMEGA1284P
    - Wind Sensor has an output voltage of 0.4V-2V
    - Can translate transmitted voltage into a wind speed

## Problems Encountered

- Lack of boards
  - Waiting on EE Office to confirm board order
- Bare Guava not functional
  - Wiring is incorrect
  - Failed to bootload and program
- EAGLE to Kicad conversion issues
  - Unfamiliar with Kicad
  - Further revisions needed

## Future Work

- Guava Network
  - Populate 6 new PCBs
  - Make sure 3 are functioning
- Development
  - Reconstruct Bare Guava
  - Develop new board design
- Other
  - Coordinate with facilities to deploy two weatherboxes
